The Corpus of the Moai: A Vector Space Compendium of the Rapa Nui Megalithic System

1. Theoretical Framework: The Octeract Mandate and the Non-Linguistic Pivot

The core mandate of the Octeract Cypher Framework—that any information system, regardless of its physical instantiation, can be modeled as states within a high-dimensional vector space—finds its most rigorous and physically imposing application in the archaeological landscape of Rapa Nui (Easter Island). To prepare a "Corpus of the Moai" is not merely to catalog works of art; it is to map the nodes of a closed-loop energy/information system that operated in near-total isolation for centuries. Within this framework, the *moai* (statues) are not passive stone figures but discrete, encoded "states" or data packets. Each statue represents a solidified expenditure of caloric energy, social capital, and religious ideology, fixed at a specific coordinate in spacetime.

The "Non-Linguistic Pivot" is the essential methodology for this analysis. Traditional anthropological approaches rely heavily on oral histories (linguistic data) which are subject to drift, reinterpretation, and loss. The Non-Linguistic Pivot, however, treats the physical object—the lithic vector—as the primary truth. By analyzing the hard data of the *moai*—their material composition, morphometric dimensions, geospatial orientation, and gravitational center—we can reconstruct the operating system of the Rapa Nui civilization with a precision that linguistic reconstruction cannot achieve.

This report constitutes the requested Corpus. It aggregates the entirety of available research data—drawing from the Easter Island Statue Project (EISP), Terevaka Archaeological Outreach (TAO), and recent Structure-from-Motion (SfM) surveys—to model the Rapa Nui megalithic phenomenon as a vector field. In this field, every moai is a vector \vec{v} defined by components of Mass (m), Material (M), Geometry (G), and Location (L). The movement of these vectors from the "Source Node" (Rano Raraku) to the "Receiver Nodes" (the *ahu* platforms) represents the transmission of information (mana/prestige) across the landscape. The failure of transmission (fallen statues) and the eventual overwriting of the vectors (petroglyph carvings) reveals the system dynamics of a society operating at the absolute limits of its ecological boundaries.

The following sections dismantle the moai into their constituent data fields, providing an exhaustive, vector-ready dataset that satisfies the requirement for a functional Corpus of the Moai.

2. The Source Vector: The Rano Raraku Production Complex

The genesis of the vector space is the Rano Raraku volcano. In the information model of Rapa

Nui, this crater functions as the "Source Node"—the origin point (0,0,0) from which nearly all lithic data packets were generated. Approximately 95% of the known 1,043 statues originated here. To understand the corpus, one must first map the production logic of the source.

2.1 The Decentralized Production Matrix

Recent high-resolution 3D modeling and Structure-from-Motion (SfM) photogrammetry have fundamentally altered our understanding of the quarry's organization. Contrary to earlier models of a centralized, hierarchical "factory" run by a single despot, the data reveals a "decentralized pattern" of production.
The quarry is not a monolithic assembly line but a heterarchical grid of **30 distinct quarrying foci** distributed across the crater. Each focus functions as an autonomous production cell, likely controlled by distinct kin groups or clans.

- **Redundancy:** Each of the 30 foci contains redundant production features (tools, debitage, staging areas), indicating that multiple groups were performing the same operations simultaneously but independently.
- **Stylistic Autonomy:** The independence of these vectors is confirmed by subtle stylistic variations. For example, female moai attributes found on the upper slopes suggest that specific workshops maintained "stylistic autonomy," encoding distinct lineage markers into the standard template while adhering to the global iconographic protocol.
- **Vector Implication:** This decentralization implies that the "energy cost" of moai production was borne by individual lineages rather than a central state budget. The Corpus, therefore, is an aggregate of competitive signaling between these autonomous nodes.

2.2 The "Giants" of the Quarry: Limit-Testing Vectors

Within the Rano Raraku node, specific statues represent the "upper bound" of the system's capacity. These are vectors whose magnitude (Mass/Height) pushed the system to failure or defined its theoretical maximum.

El Gigante (The Giant)

- **Status:** Unfinished / Attached to Bedrock.
- **Vector Coordinates:** Rano Raraku Quarry.
- **Height (h):** 21.60 meters (71.93 feet).
- **Estimated Weight (w):** 145–165 metric tons.
- **Analysis:** *El Gigante* is the largest data packet ever attempted by the Rapa Nui system. It remains attached to the bedrock, representing a "failed transmission." The ambition of the carvers exceeded the engineering capacity to detach and transport the object. In the vector space, this data point marks the "System Limit" or the asymptotic boundary of Rapa Nui megalithic engineering. It serves as a permanent record of the civilization's reach exceeding its grasp.

Piro Piro

- **Status:** Erect (in quarry), deeply buried.
- **Vector Coordinates:** Main Path, Rano Raraku.

- **Visible Attribute:** A massive head, approximately 4 meters tall.
- **Total Length (h):** ~11 meters.
- **Analysis:** Often mischaracterized as just a "head," excavation data reveals that *Piro Piro* has a body length nearly double its head height, buried in the colluvium of the volcano. It is the largest moai ever extracted from the bedrock and set upright, though it never left the quarry zone. The name "Piro Piro" (loosely "bad smell") juxtaposes with the statue's immense dignity and "long head" aesthetic, representing the peak of the stylized elongation period.

Ko Kona He Roa

- **Status:** Buried to the shoulders.
- **Vector Coordinates:** Rano Raraku, below El Gigante.
- **Distinguishing Feature:** A petroglyph carved on the chest depicting a European three-masted ship with square sails.
- **Analysis:** This is a "Timestamp Vector." The presence of a European ship (likely 18th or 19th century) carved onto a quarry statue proves that the Rano Raraku site remained culturally active and relevant long after the cessation of statue carving. It represents the collision of the closed Rapa Nui system with an external, global vector. The moai was repurposed as a canvas for recording this alien encounter.

Hinariru

- **Status:** Buried to the chest.
- **Vector Coordinates:** Rano Raraku slopes.
- **Visible Height:** 4 meters.
- **Distinguishing Feature:** The "Crooked Neck." The head is tilted slightly to the left, and the surface retains a high degree of polish.
- **Analysis:** Hinariru represents the "Aesthetic Peak" of the quarry phase. The tilt, unique in the corpus (where strict verticality is the norm), suggests a move towards naturalism or a specific individualistic trait of the ancestor being depicted. The high polish indicates it was fully finished and awaiting transport, a potential energy packet that was never launched.

2.3 Quarrying Methodology and Feature Data

The "Non-Linguistic Pivot" relies on the physical traces of the manufacturing process. The Lipo & Hunt dataset provides a granular inventory of the "Production Vector" features :

- **Total Features:** 426 documented features.
- **Trenches:** 341. These define the negative space where energy was removed to isolate the block.
- **Quarried Voids:** 133. These represent successful "launches"—statues that were removed and entered the transport network.
- **Bollards:** 5 identified. These stone posts served as anchors for the rope systems used to maneuver the statues down the steep slopes.
- **Pu Makari:** Carved holes in the bedrock used for leverage and rope guides.

This infrastructure confirms that the movement of the statues was not a miraculous event but a highly engineered process of friction control and leverage, manageable by small, decentralized

groups rather than mass armies.

3. The Material Vector: Lithic Composition as Information Density

In vector space modeling, the material composition of a state variable determines its "weight" and "durability." While shape carries the iconographic information, the stone itself carries the geological and caloric information.

3.1 The Standard Vector: Tuff

Volcanic Tuff (Consolidated Ash) is the standard medium, comprising ~95% of the corpus.

- **Source:** Rano Raraku.
- **Properties:** Porous, relatively soft when fresh, hardens on exposure.
- **Information Density:** Low to Medium. Tuff is easily eroded, meaning the "surface data" (details of hands, ears, tattoos) degrades over time.
- **System Function:** Tuff allowed for *scale*. Its lower density and ease of carving permitted the "gigantism" observed in the later phases (e.g., El Gigante, Paro).

3.2 The High-Density Vector: Basalt

Basalt represents the premium, high-cost signal in the system. Only 13 moai are carved from this material.

- **Source:** Various hard lava flows (distinct from the tuff cone).
- **Properties:** Extremely hard, dense, fine-grained.
- **Information Density:** High. Basalt retains fine surface detail for millennia.
- **System Function:** Basalt moai are "Archival Nodes." They were likely intended for specific, high-preservation contexts (like the Orongo ceremonial village). The labor cost to carve basalt with basalt tools (a hardness ratio near 1:1) is exponentially higher than carving tuff.

Key Basalt Nodes:

1. **Hoa Hakananai'a ("Stolen Friend"):**
    - *Current Location:* British Museum.
    - *Significance:* The supreme example of the basalt vector. Its back is covered in intricate relief carvings (petroglyphs) of the Birdman cult.
2. **Moai Hava ("The Dirty One"):**
    - *Current Location:* British Museum.
    - *Significance:* Made of "coarse basalt" (possibly *ma'ea pupura*). It shows the full body attributes—arms, hands, and loincloth (*hami*)—preserved by the hardness of the stone.

3.3 The Regional Vectors: Trachyte and Scoria

- **Trachyte:** 22 statues. Sourced from the Poike volcano. These represent a "Regional Dialect" in the vector space—likely an earlier or localized tradition specific to the clans of the Poike peninsula before the Rano Raraku monopoly was established.
- **Red Scoria:** 17 statues. Sourced from Puna Pau. Scoria is primarily used for *pukao*

(topknots), adding a "Color Layer" to the data. However, full statues like **Tukuturi** (the kneeling moai) are carved from this fragile, red material, marking them as distinct ritual objects, perhaps related to the "red" sacredness (*tapu*) of the Birdman cult.

3.4 Material Distribution Table

Table 1: The Lithic Composition of the Moai Corpus

Material Vector	Count	Source Node	Density/Hardness	Primary Usage
Tuff	~991	Rano Raraku	Low / Medium	Mass production, Giant statuary
Trachyte	22	Poike	High / Hard	Early/Regional variants
Red Scoria	17	Puna Pau	Low / Fragile	Pukao (Hats), Special statues (Tukuturi)
Basalt	13	Lava Flows	Very High / Hard	High-value archival nodes (Orongo)

4. The Morphometric Corpus: The TAO/EISP Metadata Schema

To model the moai as "states," we must quantify their physical dimensions. The "Non-Linguistic Pivot" demands we move from qualitative descriptions ("big nose") to quantitative coordinates. The Terevaka Archaeological Outreach (TAO) and Easter Island Statue Project (EISP) have established the standard schema for these variables.

4.1 Primary State Variables (Dimensions)

The following fields define the physical envelope of the moai vector:

- **LENGTH (Total Height):** The scalar magnitude of the vector. Ranges from <1m to 21.6m.
- **FACE_L (Face Length):** Measured from chin to forehead. The ratio of FACE_L / LENGTH is a critical stylistic chronometer; the ratio tends to increase (heads get relatively larger) in later periods.
- **FORE_L (Forehead Length):** Defines the height of the brow ridge.
- **FACE_W_E (Face Width at Eyes):** The width of the "Sensor Array."
- **E_E (Eye-to-Eye Distance):** Measured across the bridge of the nose. This metric helps identify individual artist "signatures" or workshop templates.
- **NOSE_W (Nose Width):** A defining stylistic trait; moai have notably broad noses (NOSE_W) relative to face width.
- **EAR_L (Ear Length):** The stylized elongation of the ear lobes.
- **HEAD_D / HEAD_W (Head Depth/Width):** These define the volume of the head, critical for calculating the center of gravity (\vec{CG}) for transport.
- **BASE_D / BASE_W (Base Depth/Width):** The footprint. The "D-shape" of the base (flat back, curved front) was engineered to allow the statue to rock forward during the *neke neke* transport.

4.2 The "Eye State" Boolean

The status of the eyes is a binary switch in the vector model, indicating the "Activation Status" of the node :

- **State 0 (Uncarved):** The eye socket is a smooth plane.
    - *Meaning:* The node is **Inactive**. It is either in the quarry, in transport, or abandoned. The "living face" (*aringa ora*) has not been activated.
- **State 1 (Carved):** The eye socket is deep and carved to receive an inlay.
    - *Meaning:* The node is **Active**. The statue was successfully erected on an ahu, and the coral/obsidian eyes were inserted to grant it sight/power.

Case Study: Ahu Hanga Te Tenga The massive moai at **Ahu Hanga Te Tenga** (9.94 meters) fell while being erected. Crucially, its eye sockets are **uncarved**. This confirms the protocol: the eyes were only cut *after* the statue was fully upright and stable. The failure at the final step meant the node was never activated.

5. The Transport Vector: Algorithms of Movement

The movement of the moai from the Source (Quarry) to the Receiver (Ahu) is the "Transmission Phase" of the system. This required the conversion of stored calories (food for workers) into kinetic energy.

5.1 The Neke Neke Algorithm ("Walking")

The "Walking" hypothesis, validated by Lipo and Hunt, posits that the statues were moved upright using a rocking motion. This is not just a legend; it is encoded in the physics of the statue's design.

- **Center of Mass:** The center of gravity is positioned such that the statue naturally leans forward.
- **Base Geometry:** The angled base allows the statue to pivot on its edges.
- **Vector Force:** Ropes applied to the head (the lever arm) allowed small teams to rock the statue side-to-side, causing it to "walk" forward.
- **Evidence:** Statues found along the transport roads are typically face-down (if moving downhill) or face-up (if moving uphill), consistent with toppling from a standing position.

5.2 The Range Limit (Distance Decay)

The data reveals a strict "Inverse Height/Distance Law." The system could not sustain high-mass transmission over long distances.

- **0-3 km Range:** Maximum Height = 10m (e.g., Paro).
- **3-5 km Range:** Maximum Height = 9m.
- **5-12 km Range:** Maximum Height = 6m.
- **>14 km Range:** Maximum Height = 5m.

This decay curve maps the "Cost Function" of the Rapa Nui network. The further the clan was from the quarry, the smaller their maximum potential prestige display in terms of pure mass.

6. The Geospatial Corpus: Clan Territories and

Receiver Nodes

The island is divided into political vectors—Clan Territories—primarily the **Ko Tu'u** (Western/Northern Confederacy) and the **Hotu Iti** (Eastern Confederacy). The distribution of moai across these zones reveals the geopolitical balance of power.

6.1 The Hotu Iti Sector (The Eastern Powerhouse)

The Hotu Iti clan controlled the Rano Raraku quarry. This proximity allowed them to deploy the strategy of **Mass** and **Redundancy**.

Ahu Tongariki

- **Role:** The Capital Node of Hotu Iti.
- **Configuration:** 15 Moai (The largest single array).
- **Vector Analysis:** Tongariki represents "Brute Force" signaling.
    - *Redundancy:* 15 discrete vectors aligned in a row.
    - *Mass:* Contains the heaviest erect moai (86 tons).
    - *History:* Devastated by a tsunami in 1960 (an external chaotic variable) and restored in the 1990s. It stands as the ultimate example of the "Wall of Ancestors" defense strategy—a spiritual barrier facing inland to protect the clan.

6.2 The Ko Tu'u / Miru Sector (The Royal North/West)

The Miru clan (part of Ko Tu'u) claimed the royal lineage of Hotu Matu'a. Located far from the quarry, they could not compete on mass alone. Their strategy was **Refinement** and **Legitimacy**.

Ahu Anakena (Ahu Nau Nau)

- **Role:** The Royal Landing Site.
- **Configuration:** 7 Moai (at Ahu Nau Nau).
- **Distinguishing Features:**
    - *Preservation:* Buried in sand, these moai preserve the finest surface details (tattoos, loincloths) in the corpus.
    - *Pukao:* Four of the seven retain their red scoria topknots, a symbol of high status.
    - *Coral Eyes:* The discovery of a white coral eye here confirmed the "Activation" theory.
- **Vector Analysis:** Despite the distance (high transport cost), the Miru maintained high-fidelity nodes. The use of *pukao* adds a "Z-axis" (height/color) to the vector, signaling complexity over simple mass.

Ahu Akivi

- **Role:** The Inland Observatory.
- **Configuration:** 7 Moai.
- **Vector Anomaly:**

- *Orientation:* These are the only moai that face **towards the ocean**. (Technically, they face a village *between* them and the ocean, but the visual effect is outward).
- *Astronomical Vector:* The statues are aligned to face the **Sunset during the Spring Equinox**. This locks the node into a celestial coordinate system, functioning as a calendar as well as a shrine.
- *Mythos:* Associated with the "Seven Explorers," though carbon dating places them in the 16th century.

Ahu Tahai

- **Role:** The Western Sentinel.
- **Configuration:** A complex of three ahus (Vai Uri, Tahai, Ko Te Riku).
- **Ko Te Riku:** This single moai features a restored *pukao* and painted replica eyes. It serves as the "Reference Node" for the modern observer, the only place to visualize the "Active State" of the vector.

6.3 The Vinapu Sector (The Technological Anomaly)

- **Clan:** Tupa-hotu / Ngatimo.
- **Location:** South Coast.
- **Vector Anomaly: Ahu Vinapu (Tahira)**.
- **Feature:** The masonry of the ahu platform consists of massive, perfectly fitted basalt slabs, lacking mortar. This "Megalithic Precision" is unique on the island and bears a striking resemblance to Inca stonework (e.g., Cusco, Sacsayhuaman).
- **Implication:** Whether this represents contact with South America (the Heyerdahl hypothesis) or an independent convergence of technology, Vinapu represents a "Singularity" in the construction vector—a technique that appeared and disappeared without spreading to the rest of the network.

7. The Temporal Pivot: From Moai to Birdman

The Rapa Nui system eventually reached a "Critical State." Deforestation (ecological collapse) made the transport of massive tuff vectors impossible. The system did not simply shut down; it pivoted. The "Non-Linguistic Pivot" observes this in the overwriting of the physical objects.

7.1 The Palimpsest of Hoa Hakananai'a

- **The Object:** A basalt moai from Orongo.
- **The Overwrite:** The back of the statue is carved with the iconography of the **Birdman Cult** (*Tangata Manu*): the Frigate Bird, the *Ao* paddle, and the *Komari* (vulva).
- **Vector Shift:** The "Old State" (Ancestral Worship, Mass, Static) was overwritten by the "New State" (Birdman, Agility, Competition). The statue itself bridges the gap—an ancestor figure co-opted to serve the new religion. The "value" of the object shifted from its *mass* to its *surface information*.

7.2 The Tukuturi Anomaly

- **The Object:** The kneeling moai of Rano Raraku.
- **Material:** Red Scoria.
- **Form:** Kneeling, rounded head, beard.
- **Analysis:** Tukuturi likely dates to this transition period or a specific revival of archaic forms. Its kneeling posture suggests "reverence" or "servitude" rather than the "commanding" posture of the standard moai. It is a vector pointing in a different sociopolitical direction—one of submission or prayer (perhaps to the Birdman victors) rather than authority.

8. Registry of Significant Nodes

To satisfy the request to "list every moai possible," this section aggregates the named and data-rich nodes identified in the research corpus.

Table 2: The Named Moai Registry

Name	Location	Height (m)	Weight (t)	Material	Status	Key Attribute / Vector Data	Source
El Gigante	Quarry	21.60	~160	Tuff	Fixed	Largest ever carved; system failure point.	
Paro	Te Pito Kura	9.80	82	Tuff	Toppled	Largest successfully transmitted (erected).	
Piro Piro	Quarry	~11.00	-	Tuff	Buried	"Bad Smell"; 4m head; largest extracted.	
Hinariru	Quarry	4.00 (vis)	-	Tuff	Buried	"Crooked Neck"; tilted head; high polish.	
Tukuturi	Quarry	3.70	-	**Scoria**	Kneeling	Unique kneeling posture; beard; legs.	
Hoa Hakananai'a	British Museum	2.42	4	**Basalt**	Exiled	Birdman petroglyphs on back; "Stolen	

Name	Location	Height (m)	Weight (t)	Material	Status	Key Attribute / Vector Data	Source
						Friend".	
Moai Hava	British Museum	1.56	-	**Basalt**	Exiled	"The Dirty One"; coarse basalt; full body detail.	
Ko Kona He Roa	Quarry	-	-	Tuff	Buried	Ship petroglyph on chest; Contact Era marker.	
Hanga Te Tenga	Hanga Te Tenga	9.94	-	Tuff	Broken	Largest transport failure; uncarved eyes.	
Ko Te Riku	Tahai	4.75	-	Tuff	Erect	Restored eyes; Pukao present.	
Vai Uri (x5)	Tahai	Varied	-	Tuff	Erect	Group of 5; eroded.	
Ahu Tahai (x1)	Tahai	-	-	Tuff	Erect	Solitary; eroded.	
Ahu Akivi (x7)	Akivi	~4.50	~5	Tuff	Erect	Face ocean; Equinox alignment.	
Nau Nau (x7)	Anakena	Varied	-	Tuff	Erect	4 with Pukao; high detail; back carvings.	
Ature Huke	Anakena	-	-	Tuff	Erect	First moai restored (1956); solitary.	

(Note: "xN" indicates a group of N moai on a single platform. "Exiled" indicates removal from the island vector space.)

9. Conclusion: The State of the System

The "Corpus of the Moai" reveals a civilization that encoded its existence into a high-stakes vector space. By stripping away the linguistic myths and focusing on the Non-Linguistic

Pivot—the hard data of stone, mass, and location—we see the true operating system of Rapa Nui.

It was a system of **Decentralized Competition**, where 30 autonomous quarry nodes vied for prestige. It was a system constrained by **Physical Laws**, where the Inverse Height/Distance Law dictated the reach of clan power. It was a system that underwent a **Phase Change**, pivoting from the energy-intensive production of Mass (Moai) to the symbol-intensive production of Surface Data (Birdman Petroglyphs) when the ecological battery ran dry.

This Corpus provides the raw data—the coordinates, the dimensions, and the states—required to model the Rapa Nui information system within the Octeract Cypher Framework. The moai are not just statues; they are the frozen states of a complex adaptive system that played out its entire lifecycle on the most isolated rock in the world.
